

CSS Part Deux: Display and Positioning

Codecademy Ready

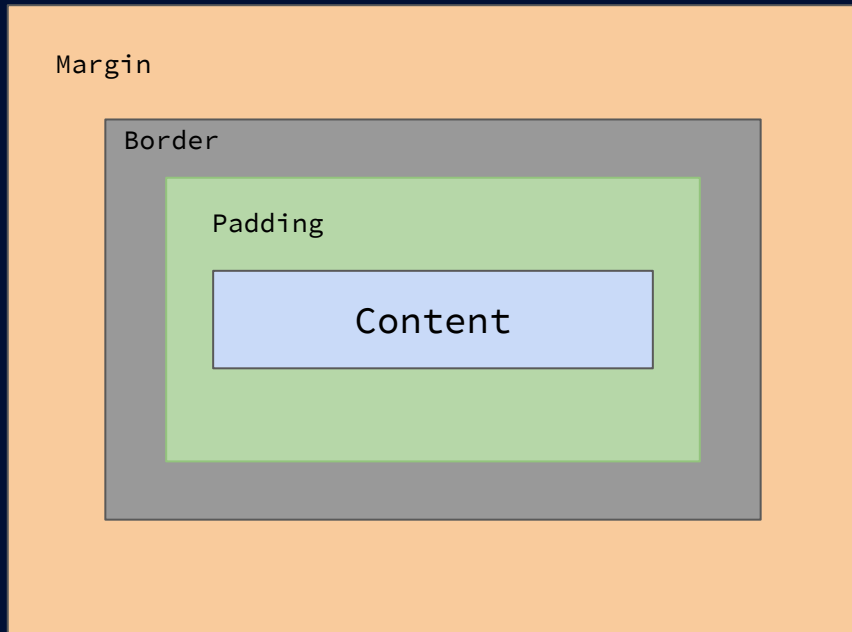

<https://github.com/jesselumarie>

@jesselumarie

Plan

- * Box Model
- * Positioning
- * Flexbox
- * Live-coding: Let's get weird

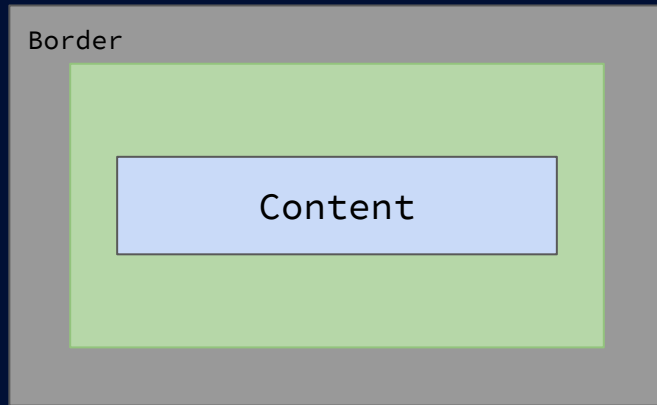

Box Model

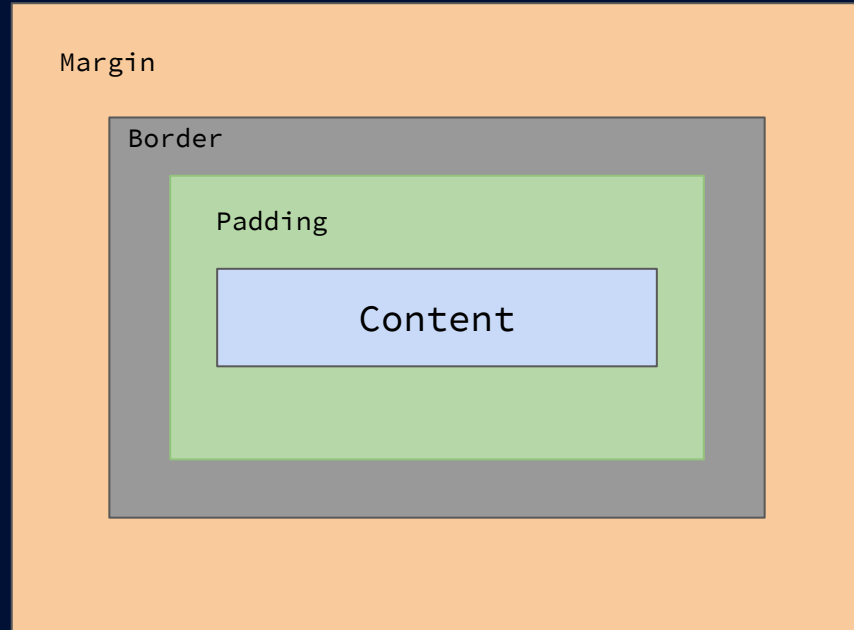

Padding

Border

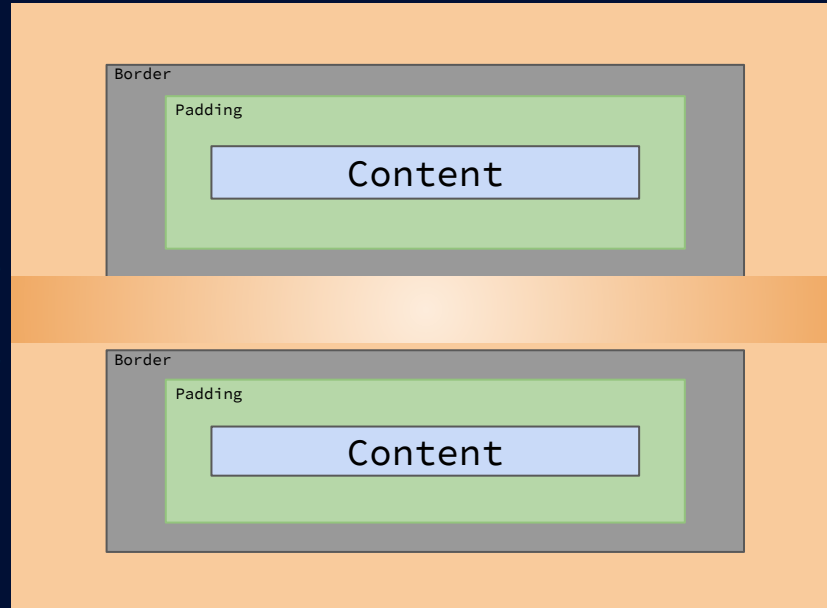

Margin

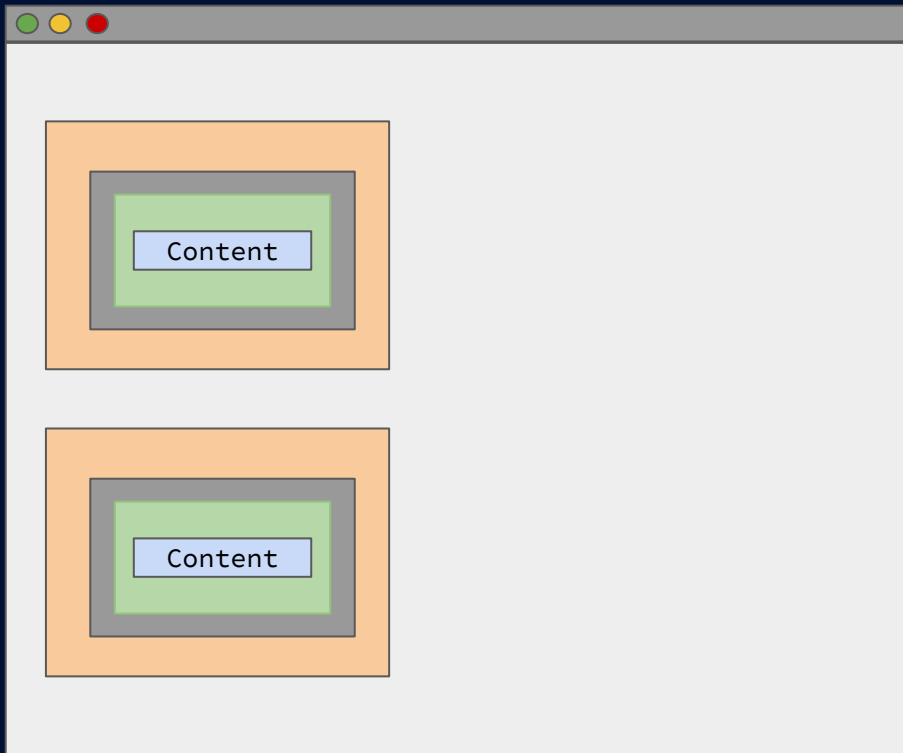

Margin Collapse (vertical only)

Margin Collapse

Block

`<div>`

`<h1>`

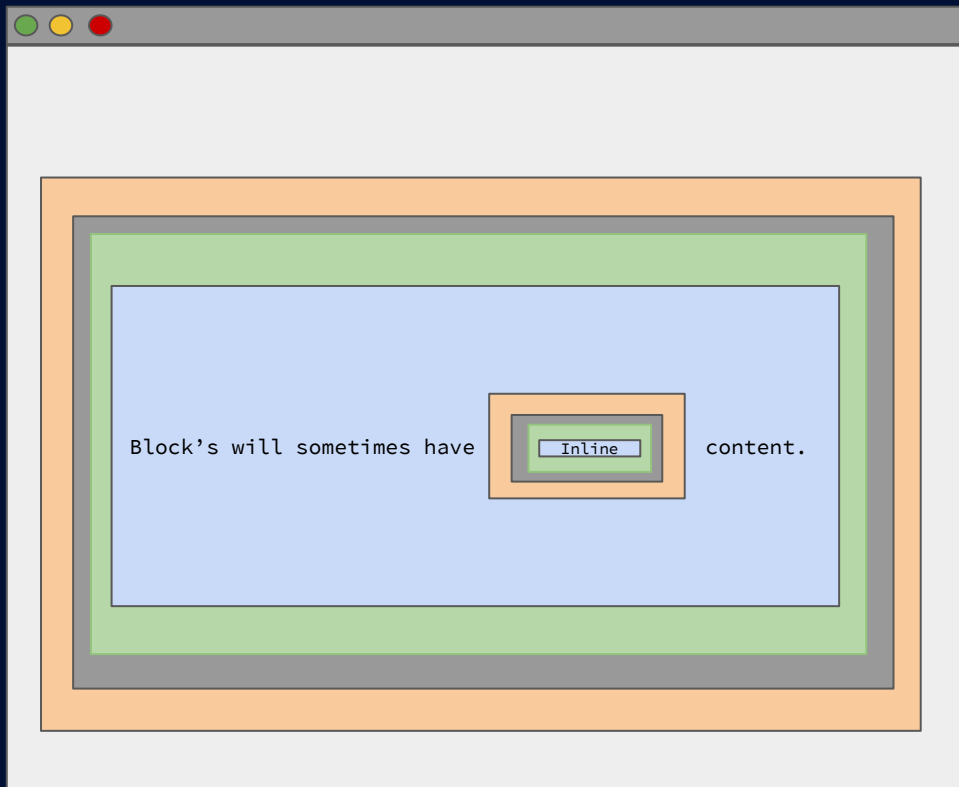

`<p>`

``

``

...and so
much more!

In-line

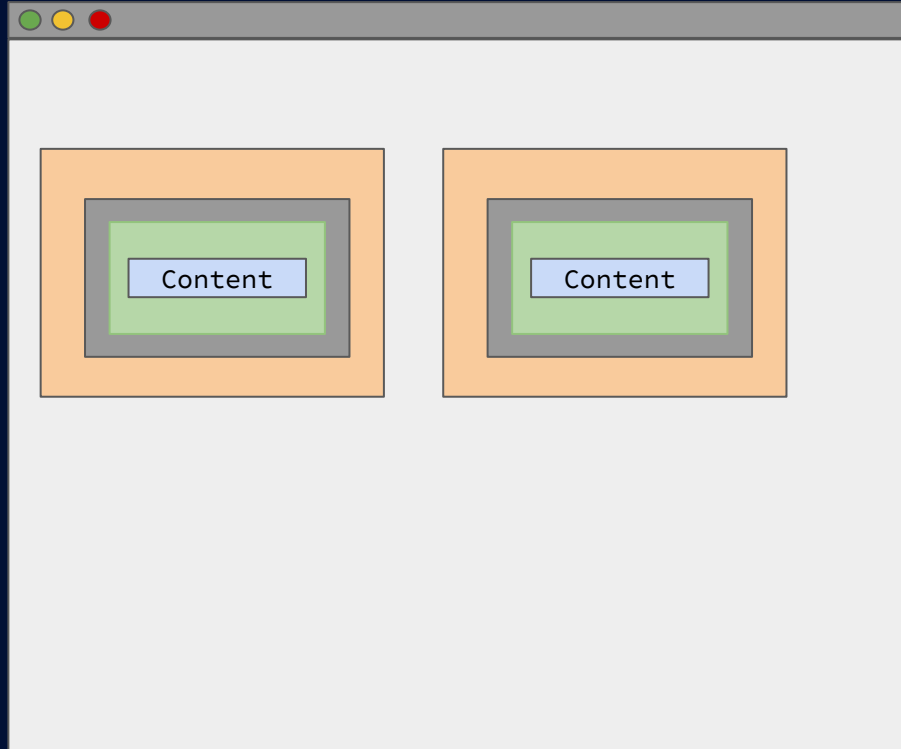

<a>

<code>

...and so
much more!

Inline-Block

Positioning

Static

Relative

Absolute

Fixed

Static

The status quo

Relative

- * Positions relative to where it would be
- * Other elements stay in “normal position”

Absolute

- * Positioned in relation to nearest non-static element
- *  aka the nearest relative/absolute element

Fixed

- * Use these for “floating elements”
- * Think scroll bars and messaging icons

Questions?

Flexbox

When not to use Flexbox (maybe `~_(\ツ)_/~`)

- * For the full page layout
- * When a large part of your site's traffic is slow (think 2G/3G)

Let's get weird with CSS
